

R&S®NRQ6

Frequency Selective Power Sensor

A milestone in power measurements

R&S®NRQ6

Frequency Selective Power Sensor

At a glance

The R&S®NRQ6 combines the accuracy of a power meter with the dynamic range of a spectrum analyzer. It performs extremely precise and fast power measurements down to -130 dBm.

The R&S®NRQ6 is based on receiver technology and can perform band-limited power measurements – i.e. power measurements on a selected transmission channel – down to -130 dBm. The R&S®NRQ6 delivers high-precision, high-speed measurements beyond the limits of currently available power meters.

In addition to conventional continuous average measurements, the R&S®NRQ6 has a trace display function and also performs ACLR measurements – a common mobile communications application. Using the optional R&S®NRQ6-K1 I/Q data interface, I/Q data can be downloaded from the power sensor to a PC for further analysis.

The R&S®NRQ6 is controlled via LAN, requiring power over Ethernet (PoE+). The sensor's integrated web server makes it possible to operate the GUI without any extra software – all that is needed is a PC with a web browser. The intuitive GUI is well structured and easy to operate thanks to diverse autoset functions.

Key facts

- Frequency selective power measurements
- Frequency range: 50 MHz to 6 GHz
- Power measurement range: -130 dBm to $+20$ dBm
- Automatic frequency and bandwidth detection
- 100 MHz measurement bandwidth
- Continuous average, trace and ACLR measurements
- I/Q data capturing for RF vector signal analysis

Benefits and key features

Diverse measurement functions

- ▮ Continuous average power measurements down to -130 dBm – precise and fast
- ▮ I/Q data capturing for RF vector signal analysis
- ▮ Trace measurements
- ▮ Ultrafast triggered measurements
- ▮ Easy ACLR measurements

▸ [page 4](#)

Easy operation

- ▮ Intuitive web GUI
- ▮ Diverse autoset functions
- ▮ Automatic frequency tracking
- ▮ Spectrum display for signal check
- ▮ Hardware interfaces for user convenience

▸ [page 6](#)

Applications

- ▮ TX power calibration
- ▮ Band-limited power measurements on multistandard radios (MSR)

▸ [page 7](#)

I/Q data interface.

Diverse measurement functions

Continuous average power measurements down to -130 dBm – precise and fast

Conventional diode power sensors reach their physical limits at approx. -70 dBm. Fast measurements degrade accuracy especially at low power levels, since the noise content measured by these sensors is relatively high. As a result, either speed or accuracy has to be sacrificed.

The receiver based architecture of the R&S®NRQ6 eliminates this problem. This concept provides lower measurement noise. In addition, the sensor's ability to perform band-limited measurements reduces the noise floor. These characteristics enable high-precision, high-speed measurements down to -130 dBm.

I/Q data capturing for RF vector signal analysis

The R&S®NRQ6 can be used as a standalone RF frontend to capture vector-modulated I/Q signals.

With the optional R&S®NRQ6-K1 I/Q data interface, captured I/Q data can be read out using SCPI commands. The data is demodulated and analyzed using external software.

Automated, cloud-based data processing and analysis is also possible using the R&S®Quickstep test executive software to control any analysis tool in order to measure error vector magnitude (EVM), adjacent channel leakage ratio (ACLR) and other TX performance parameters.

Signal analysis with R&S®QuickStep test executive software.

Trace measurement on a pulsed signal.

Trace measurements

A detailed trace display is necessary for a precise analysis of short pulses. With an inherent rise/fall time of 13 ns at a resolution bandwidth of 50 MHz, for example, the R&S®NRQ6 can easily measure steep-edged pulses.

Ultrafast triggered measurements

Triggered measurements in particular call for ever higher measurement speeds over an extended period of time. The R&S®NRQ6 contains a powerful FPGA and a large memory to meet these requirements. More than 100 000 triggered readings can be stored in a buffer in 200 ms – corresponding to a measurement speed of 500 000 readings/s – and transferred to a control PC.

Easy ACLR measurements

The frequency selective power sensor is perfect for adjacent channel leakage ratio (ACLR) measurements, which are frequently required in mobile communications. The ACLR measurement function is accessible from the web GUI and automatically sets one of the predefined 3GPP or LTE filters. The R&S®NRQ6 achieves an ACLR performance of typically -63 dBc for a 20 MHz LTE signal at -20 dBm.

ACLR measurement on a 3.84 MHz 3GPP signal.

Easy operation

Intuitive web GUI

The R&S®NRQ6 is connected to the LAN via a PoE+ switch. The sensor includes an integrated web server. The intuitive web GUI can be operated from any web browser.

Diverse autosest functions

Diverse autosest functions are available to simplify configuration of the main measurement parameters. The measurement frequency and signal bandwidth are automatically determined and set. As a result, even unknown signals are detected and average power is measured accurately.

Depending on the input level, the 30 dB RF input attenuator is automatically switched on or off to configure the optimal power measurement range.

The trace mode also offers autosest functions. For example, the time scale (x-axis) and the power scale (y-axis) can be optimally configured. A trigger is set automatically, ensuring stable display of the measured signal.

Rear view of the R&S®NRQ6 with hardware interfaces.

Automatic frequency tracking

A frequency tracker automatically sets the center frequency to facilitate measurements on narrowband signals with varying center frequency. This ensures that the measured signal is always within the selected measurement bandwidth.

Spectrum display for signal check

Since power measurements are performed only in the set frequency range (defined by center frequency and bandwidth), the settings must be checked to make sure they are correct. The signal check function provides a graphical display of the measured signal's spectrum and the set bandwidth. Users can see at a glance if the measured signal is within the set frequency range.

Hardware interfaces for user convenience

The R&S®NRQ6 can be easily integrated into a test system. Remote operation is possible via LAN and USB.

The trigger I/O port can accept an external trigger signal or distribute an internally generated trigger signal to other R&S®NRQ6 power sensors.

An external LO signal can be fed to one of the R&S®NRQ6 power sensors, or the internal LO signal can be output and distributed to the other sensors.

The R&S®NRQ6 has a reference I/O port, e.g. for applying an external reference signal, and a sample clock I/O port.

Signal check for a 20 MHz LTE signal.

Applications

TX power calibration

To calibrate a DUT's transmit power, it is necessary to measure the frequency response at higher levels and the linearity down to minimum levels. The R&S®NRQ6 performs both measurements. The sensor not only stands out for its high-precision power measurements, it also features excellent linearity of 0.02 dB. The R&S®NRQ6 is a compact, single-device solution for calibrating transmit power. No additional instruments or components such as a splitter and spectrum analyzer are needed. The sensor can be directly connected to the DUT; no cable is required. This solution provides better stability, lower mismatch and higher accuracy.

Band-limited power measurements on multistandard radios (MSR)

The R&S®NRQ6 can perform band-limited power measurements, i.e. it can measure the power on a selected transmission channel with a bandwidth up to 100 MHz, independent of neighboring channels. Band-limited power measurements can also be performed on base stations that support multiple mobile communications standards (MSR base stations), even if the user wants to measure only one standard.

Single-channel power measurement on an MSR signal.

Specifications

Definitions

General

Product data applies under the following conditions:

- Three hours storage at ambient temperature followed by 30 minutes warm-up operation
- Specified environmental conditions met
- Recommended calibration interval adhered to
- All internal automatic adjustments performed, if applicable

Specifications with limits

Represent warranted product performance by means of a range of values for the specified parameter. These specifications are marked with limiting symbols such as $<$, \leq , $>$, \geq , \pm , or descriptions such as maximum, limit of, minimum. Compliance is ensured by testing or is derived from the design. Test limits are narrowed by guard bands to take into account measurement uncertainties, drift and aging, if applicable.

Specifications without limits

Represent warranted product performance for the specified parameter. These specifications are not specially marked and represent values with no or negligible deviations from the given value (e.g. dimensions or resolution of a setting parameter). Compliance is ensured by design.

Typical data (typ.)

Characterizes product performance by means of representative information for the given parameter. When marked with $<$, $>$ or as a range, it represents the performance met by approximately 80% of the instruments at production time. Otherwise, it represents the mean value.

Nominal values (nom.)

Characterize product performance by means of a representative value for the given parameter (e.g. nominal impedance). In contrast to typical data, a statistical evaluation does not take place and the parameter is not tested during production.

Measured values (meas.)

Characterize expected product performance by means of measurement results gained from individual samples.

Uncertainties

Represent limits of measurement uncertainty for a given measurand. Uncertainty is defined with a coverage factor of 2 and has been calculated in line with the rules of the Guide to the Expression of Uncertainty in Measurement (GUM), taking into account environmental conditions, aging, wear and tear.

Device settings and GUI parameters are indicated as follows: "parameter: value".

Typical data as well as nominal and measured values are not warranted by Rohde&Schwarz.

In line with the 3GPP/3GPP2 standard, chip rates are specified in Mcps (million chips per second), whereas bit rates and symbol rates are specified in Mbps (million bits per second), kbps (thousand bits per second), Msps (million symbols per second) or ksps (thousand symbols per second), and sample rates are specified in Msample/s (million samples per second). Mcps, Mbps, Msps, kbps, ksps and Msample/s are not SI units.

R&S®NRO6 power sensor signal flow from RF input connector to result processing

Specifications

Frequency range		50 MHz to 6.0 GHz		
Impedance matching (SWR)	50 MHz to 100 MHz	< 1.20		
	> 100 MHz to 2.0 GHz	< 1.13

Weight		0.50 kg (1.10 lb)

- ¹⁾ By default, the discrete RBW filter selection mode (1, 2, 3, 5, ... steps) is active. Alternatively, steplessly variable RBW can be activated for $RBW \leq 20$ MHz. The SNR in the variable RBW selection mode may be slightly lower than in the discrete RBW selection mode.
- ²⁾ The sample rate is selected automatically.
- ³⁾ This applies to resolution bandwidths ≤ 300 kHz. For larger RBWs, spurious frequency response contributions might violate these limits at certain RF input frequencies. In addition, RBWs using zero IF mode might violate these limits due to DC offset contributions.
- ⁴⁾ Expanded uncertainty ($k = 2$) for absolute continuous average power measurements on CW signals centered within RBWs ≤ 10 MHz. Specifications include calibration uncertainty, aging, linearity and temperature effect. Measurement noise must additionally be taken into account when measuring low powers. The contribution of measurement noise can be neglected below a two-sigma value of 0.01 dB. For signal power levels less than 30 dB above the DANL at the selected RBW, a measurement bias must additionally be taken into account. For power levels above +15 dBm/−15 dBm for 30 dB/0 dB RF input attenuation, respectively, uncertainty contributions due to intermodulation and other nonlinear effects must additionally be taken into account. For RBWs below 1 kHz, LO phase noise contributions must additionally be taken into account. For RBWs above 300 kHz, uncertainty contributions due to coherent spurious response frequencies (e.g. when a locked reference frequency is used) must additionally be taken into account. When configuring the power sensor for use with an externally supplied LO signal, uncertainty contributions due to the signal integrity of the external LO signal must additionally be taken into account. Signal integrity includes properties such as frequency accuracy, and amplitude and phase stability.
- ⁵⁾ Expanded uncertainty ($k = 2$) for relative power measurements on CW signals of identical frequency in continuous average mode for $RBW \leq 10$ MHz. Specifications include aging and temperature effect. Measurement noise must additionally be taken into account. For signal power levels less than 30 dB above the DANL at the selected RBW, a measurement bias must additionally be taken into account. For RBWs below 1 kHz, LO phase noise contributions must additionally be taken into account. For RBWs above 300 kHz, uncertainty contributions due to coherent spurious response frequencies (e.g. when a locked reference frequency is used) must additionally be taken into account. When configuring the power sensor for use with an externally supplied LO signal, uncertainty contributions due to the signal integrity of the external LO signal must additionally be taken into account. Signal integrity includes properties such as frequency accuracy, and amplitude and phase stability.
- ⁶⁾ The IF frequency is selected automatically.
- ⁷⁾ Measurements were performed using two-tone signals separated by 2 MHz.
- ⁸⁾ For average power measurements of periodic bursts.
- ⁹⁾ To increase measurement speed, the power sensor can be operated in buffered mode. In this mode, measurement results are stored in a buffer of user-definable size and output as a data block when the buffer is full. For further information, see application sheet "R&S®NRQ6. Fast Pulse Power Measurement" (1178824202).
- ¹⁰⁾ Noise correction improves the ACLR by typ. 5 dB, depending on the level and bandwidth.
- ¹¹⁾ In I/Q trace mode, only positive trigger delays are supported.
- ¹²⁾ The operating temperature range defines the span of ambient temperature in which the instrument complies with specifications.

Extended Warranty with Accredited Calibration Coverage, two years	R&S®AW2	

Extended warranty with a term of one and two years (WE1 and WE2)

Repairs carried out during the contract term are free of charge²⁾. Necessary calibration and adjustments carried out during repairs are also covered.

Extended warranty with calibration coverage (CW1 and CW2)

Enhance your extended warranty by adding calibration coverage at a package price. This package ensures that your Rohde & Schwarz product is regularly calibrated, inspected and maintained during the term of the contract. It includes all repairs²⁾ and calibration at the recommended intervals as well as any calibration carried out during repairs or option upgrades.

Extended warranty with accredited calibration (AW1 and AW2)

Enhance your extended warranty by adding accredited calibration coverage at a package price. This package ensures that your Rohde & Schwarz product is regularly calibrated under accreditation, inspected and maintained during the term of the contract. It includes all repairs²⁾ and accredited calibration at the recommended intervals as well as any accredited calibration carried out during repairs or option upgrades.

¹⁾ For options that are installed, the remaining base unit warranty applies if longer than 1 year. Exception: all batteries have a 1 year warranty.

²⁾ Excluding defects caused by incorrect operation or handling and force majeure. Wear-and-tear parts are not included.
